Question No. 1

A Database Specialist is creating a new Amazon Neptune DB cluster, and is attempting to load data from Amazon S3 into the Neptune DB cluster using the Neptune bulk loader API. The Database Specialist receives the following error:

"Unable to connect to s3 endpoint. Provided source = s3://mybucket/graphdata/ and region = us-east-1. Please verify your S3 configuration."

Which combination of actions should the Database Specialist take to troubleshoot the problem? (Choose two.)

- **A.** Check that Amazon S3 has an IAM role granting read access to Neptune
- **B.** Check that an Amazon S3 VPC endpoint exists
- **C.** Check that a Neptune VPC endpoint exists
- **D.** Check that Amazon EC2 has an IAM role granting read access to Amazon S3
- **E.** Check that Neptune has an IAM role granting read access to Amazon S3

Answer: B, D

Question No. 2

A retail company with its main office in New York and another office in Tokyo plans to build a database solution on AWS. The company's main workload consists of a mission-critical application that updates its application data in a data store. The team at the Tokyo office is building dashboards with complex analytical queries using the application data.

a. The dashboards will be used to make buying decisions, so they need to have access to the application data in less than 1 second.

Which solution meets these requirements?

- **A.** Use an Amazon RDS DB instance deployed in the us-east-1 Region with a read replica instance in the ap-northeast-1 Region. Create an Amazon ElastiCache cluster in the ap-northeast-1 Region to cache application data from the replica to generate the dashboards.
- **B.** Use an Amazon DynamoDB global table in the us-east-1 Region with replication into the ap-northeast-1 Region. Use Amazon QuickSight for displaying dashboard results.
- **C.** Use an Amazon RDS for MySQL DB instance deployed in the us-east-1 Region with a read replica instance in the ap-northeast-1 Region. Have the dashboard application read from the read replica.
- **D.** Use an Amazon Aurora global database. Deploy the writer instance in the us-east-1 Region and the replica in the ap-northeast-1 Region. Have the dashboard application read from the replica ap-northeast-1 Region.

Answer: D

Question No. 3

A company is using Amazon RDS for PostgreSQL. The Security team wants all database connection requests to be logged and retained for 180 days. The RDS for PostgreSQL DB instance is currently using the default parameter group. A Database Specialist has identified that setting the `log_connections` parameter to 1 will enable connections logging.

Which combination of steps should the Database Specialist take to meet the logging and retention requirements? (Choose two.)

- **A.** Update the `log_connections` parameter in the default parameter group
- **B.** Create a custom parameter group, update the `log_connections` parameter, and associate the parameter with the DB instance
- **C.** Enable publishing of database engine logs to Amazon CloudWatch Logs and set the event expiration to 180 days
- **D.** Enable publishing of database engine logs to an Amazon S3 bucket and set the lifecycle policy to 180 days
- **E.** Connect to the RDS PostgreSQL host and update the `log_connections` parameter in the `postgresql.conf` file

Answer: A, E

Question No. 4

A company developed an AWS CloudFormation template used to create all new Amazon DynamoDB tables in its AWS account. The template configures provisioned throughput capacity using hard-coded values. The company wants to change the template so that the tables it creates in the future have independently configurable read and write capacity units assigned.

Which solution will enable this change?

- **A.** Add values for the `rcuCount` and `wcuCount` parameters to the Mappings section of the template. Configure DynamoDB to provision throughput capacity using the stack's mappings.
- **B.** Add values for two Number parameters, `rcuCount` and `wcuCount`, to the template. Replace the hard-coded values with calls to the `Ref` intrinsic function, referencing the new parameters.
- **C.** Add values for the `rcuCount` and `wcuCount` parameters as outputs of the template. Configure DynamoDB to provision throughput capacity using the stack outputs.
- **D.** Add values for the `rcuCount` and `wcuCount` parameters to the Mappings section of the template. Replace the hard-coded values with calls to the `Ref` intrinsic function, referencing the new parameters.

Answer: B

Question No. 5

A Database Specialist must create a read replica to isolate read-only queries for an Amazon RDS for MySQL DB instance. Immediately after creating the read replica, users that query it report slow response times.

What could be causing these slow response times?

- **A.** New volumes created from snapshots load lazily in the background
- **B.** Long-running statements on the master
- **C.** Insufficient resources on the master
- **D.** Overload of a single replication thread by excessive writes on the master

Answer: A
